

Mount Everest

Mount Everest is Earth's highest mountain above sea level, located in the Mahalangur Himal sub-range of the Himalayas. Its peak sits at an elevation of 8,849 meters, on the border between Nepal and the Tibet Autonomous Region of China.

The mountain is known as Sagarmatha in Nepali and Chomolungma in Tibetan. It was named in English after Sir George Everest, a former Surveyor General of India, though he himself opposed having the mountain named after him.

Sir Edmund Hillary of New Zealand and Tenzing Norgay, a Sherpa of Nepal, made the first confirmed successful ascent to the summit in 1953 as part of a British expedition.

Climbing Everest is extremely dangerous due to factors including extreme altitude, low oxygen levels, unpredictable weather, avalanches, and crevasses. The region above 8,000 meters is often referred to as the death zone because the air pressure is too low to sustain human life for extended periods.

Thousands of climbers have successfully summited Everest since 1953, but the mountain has also claimed hundreds of lives. Commercial guided expeditions have made the climb more accessible, though it remains a costly and physically demanding undertaking.
